Appium XPath Formula Sheet (1 Page)

Basic XPath Formula

//class[@attribute='value']

Common XPath Formulas

- //android.widget.TextView[@text='Login'] → By text
- //android.widget.Button[@resource-id='com.app:id/btnLogin'] → By resource-id (BEST)
- //android.widget.ImageView[@content-desc='Profile'] → By accessibility id
- (//android.widget.EditText)[2] → By index (avoid if possible)
- //android.widget.TextView[contains(@text,'Wel')] → Dynamic text
- //TextView[@text='Email']/following-sibling::EditText → Relative XPath
- //TextView[@text='Password']/parent::*/EditText → Parent-child relation
- //TextView[@text='Username']/following::EditText[1] → Following element

Best Practices

- Prefer resource-id or accessibility-id over XPath
- Avoid absolute XPath starting with /hierarchy
- Use relative XPath for stability
- Keep XPath short and readable

Interview One-Liner

XPath in Appium is created using class and stable attributes like text, resource-id, or content-desc to locate mobile elements.
